Preface

The academic discipline of business informatics addresses the combination and integration of concepts, approaches, and technologies from computer science, information systems, economics, and business administration with a focus on applications in enterprises, public authorities, and other organizations. Business informatics is closely related to the area of business information systems.

The conference series on Business Informatics Research (BIR) was established in the year 2000 as the result of a collaboration of several Swedish and German universities. The goal was to create a forum for the discussion of latest research results, new research directions, and PhD topics in the business informatics community. The conference has expanded to many other countries, and usually includes workshops as well as a doctoral consortium accompanying the main conference track. The BIR conference series has a Steering Committee, to which representatives from the organizations hosting a BIR conference are invited. The 18th BIR conference was located in Katowice, Poland, during September 23–25, 2019, at the Advanced Information Technology Center of the University of Economics in Katowice.

The theme of the conference was “Responsibilities of Digitalization – Responsible designing and shaping of future technology for digital preservation, global data storage, and cost-effective management.” Digitalization rapidly changes wireless, bio, and info-tech ecosystems, and enterprises must find new ways to innovate for business advantage and sustainability. Through digital transformation, the implementation of new technologies, like cloud, mobile, big data, and social networks increases intelligence and automation enterprises can capitalize on new business and optimization opportunities. Business leaders and Information Communication Technology (ICT) system developers need democratic innovation culture as well as new approaches to system design and exploitation. BIR 2019 is focused on the development of ICT systems to ensure system responsiveness, user friendliness, project agility, information availability and security, business continuity, system functionality, scalability, and efficiency. However, the ICT people are expected to develop technologies, systems, and methods while taking into account the consequences of their designs and implementations. Responsible designing of the future requires a change of ethics and learning methods to include different points of view (i.e., society, organization, individual, and information systems).

This year, the main conference track attracted 61 submissions from 22 countries. Each paper was reviewed by at least three members of the Program Committee. As a result, 17 high-quality papers were selected for publication in this volume and for presentation at the conference. They cover different aspects of the conference’s main topic as well as of business informatics research in general.

The conference program also included three keynotes: “Behavioral Enterprise Architecture (management) – designing interventions based on behavioral insights” by Prof. Robert Winter from the University of St. Gallen (Switzerland); “Smart

Recommendation Systems – managerial viewpoints” by Prof. Jerzy Korczak from the International University of Logistics and Transport, Wrocław (Poland); and “In a World of Biased Search Engines” by Prof. Dirk Lewandowski from the Hamburg University of Applied Sciences (Germany).

We would like to thank everyone who contributed to the BIR 2019 conference. We thank the authors for contributing and presenting their research, we appreciate the invaluable contribution of the members of the Program Committee and the external reviewers, we thank the keynote speakers for their inspiring talks, and we thank all members of the local organization team from Katowice.
