THIS FILE CONSISTS OF ANCILLARY MATERIAL SUPPORTING THE TEACHING CASE TITLED; “*ENTERPRISE BUSINESS PROCESS MANAGEMENT IN THE PUBLIC SECTOR: THE CASE OF THE DEPARTMENT OF HUMAN SERVICES (DHS) AUSTRALIA*”, PUBLISHED IN THE JOURNAL OF INFORMATION TECHNOLOGY TEACHINGS CASES.

THE AUTHORS FOR THIS TEACHING CASE ARE:

- DR WASANA BANDARA (*CORRESPONDING AUTHOR*)
- SCOTT BAILEY (DEPARTMENT OF HUMAN SERVICES, AUSTRALIA)
- DR PAUL MATHIESEN (FORMER EMPLOYEE OF QUEENSLAND UNIVERSITY OF TECHNOLOGY)
- JO MCCARTHY (FORMER EMPLOYEE OF DEPARTMENT OF HUMAN SERVICES, AUSTRALIA)
- CHRIS JONES (DEPARTMENT OF HUMAN SERVICES, AUSTRALIA)

Ancillary Material Supporting the Teaching Case:

“ENTERPRISE BUSINESS PROCESS MANAGEMENT IN THE PUBLIC SECTOR: THE CASE OF THE DEPARTMENT OF HUMAN SERVICES (DHS) AUSTRALIA”

Brief Introduction

This Ancillary Material file consists of 4 parts, each which provides useful additional information in the form of detailed documents/ artefacts associated with the E-BPM efforts at the described case; Department of Human Services (DHS) in the teaching case “ENTERPRISE BUSINESS PROCESS MANAGEMENT IN THE PUBLIC SECTOR: THE CASE OF THE DEPARTMENT OF HUMAN SERVICES (DHS) AUSTRALIA”

Part 1, presents two files (Part A and B) of the Business Process modelling guidelines designed and used at the Department.

Part 2, presents the documented BPM strategic Plan 2015-2017

Part 3, provides an organisational chart of the case organisation, indicating the different organisational units that are engaged with the current BPM efforts

Part 4, provides the Process Governance plan 2015-2017

Part 1: Business Process modelling guidelines

See two separate documents (Part A and B) below that describes the modelling guidelines

Part A contains **standards and rules** on how to use each element of BPMN.

Part B contains **guidelines** for modelling in the BPMN 2.0 modelling language.

1 Introduction

Business Process Management (BPM) is a management discipline that treats business processes as assets that directly improve enterprise performance by driving operational excellence and business agility¹. Business Process Management focuses on the optimum management of an organisation's processes to meet the organisation's strategic goals. A strategic approach to business process management focuses on the end to end processes for an organisation from the customer or client's perspective, enabling the organisation to deliver against its outcomes and improve its services.

The primary goal of Business Process Model and Notation (BPMN) is to provide a notation that is readily understandable by all business users. BPMN is a common language to bridge the gap between business process design and process implementation.

BPMN 2.0 specification will assist DHS in conducting Business Process Management through the provision of a standardised notation for all process models. BPMN is a process centric notation that is focused on business activities and not the technical solutions that may be implemented. BPMN is managed by the Object Management Group (OMG) which provides a specification on how BPMN is used. BPMN is a world leading notation and is currently being used by a large number of government departments and private organisations.

1.1 Purpose

The purpose of this document is to define the standards for business process modelling within the department to create modelling consistency.

This document contains the following information regarding the BPMN 2.0 modelling language

- Model preview
- Model description
- Element preview
- Element description
- Element rules
- Recommended attributes for ARIS objects and model types
- Recommended naming conventions

The elements referenced in this document are a sub-set of approved elements extracted from the Object Management Group standards.

1.2 Target Audience

The target audience of this document is -

- Business Process Modellers / Designers
- Business Analysts
- System Analysts
- Process Owner
- Business Owner

¹ Source: Gartner

2 Process Model Types

DHS utilises the following two formats of BPMN 2.0 models:

- BPMN 2.0 Process Diagram
- BPMN 2.0 Collaboration Diagram

2.1 BPMN 2.0 Collaboration Diagram

BPMN 2.0 Collaboration diagrams are used to depict finite business processes. They represent the messages that occur between processes and/or other parties. BPMN 2.0 Collaboration diagrams depict the process with a minimum of two participants each with their own pool.

Figure 1: BPMN 2.0 Collaboration Diagram

2.2 BPMN 2.0 Process Diagram

BPMN 2.0 Process Diagrams are used to depict a set of unique activities which are represented by a sub-process object BPMN 2.0 collaboration diagram. A BPMN 2.0 Process Diagram contains the expanded set of activities and does not contain pools or lanes as it is limited to one role or pool.

Figure 2: Process Diagram - expanded from Figure 1

3 BPMN 2.0 Elements

Business Process Model and Notation 2.0 provides the department with a range of elements available to visually represent processes and provide meaning and opportunity for improvement. DHS does not employ the complete set however; the following are the approved elements types used:

- Participants (Pools)
- Lanes (Swimlanes)
- Activities (Tasks)
- Events
- Gateways
- Connecting elements
- Artefacts
- Data objects and stores

3.1 Participants & Lanes (Pools & Swimlanes)

Element Name	Element Notation	Element Description
Pool (participants)		A pool is used to show a participant(s) in a collaboration diagram. A participant is anyone (individual, group, organisation etc) impacted by the process being modelled. The number and participant types will vary from one model to another, but it is defined as an entity separate to the main process. Common examples are 'Customer/Third Party' or 'Department of Human Services (DHS)'. A pool with internal visibility and execution of a process is referred to as "White-box Pool", whereas a pool without process no visibility is called a "Black-box Pool" A pool always runs horizontal. A pool must have at least one named lane but can have as many lanes as necessary to detail the process.
Lane		A lane is a sub-partition within a pool to show individual process responsibilities. Common examples would be 'Service officer' or 'Manager'. A lane always runs horizontal within the pool.

		All lanes must be named.
--	--	--------------------------

3.2 Events

An event is something that “happens” during the course of a process. These events affect the flow of the model and usually have a cause (trigger) or an impact (result).

Events are circles with open centres to allow internal markers to differentiate different triggers or results. There are three types of events, based on when they affect the flow:

- A **Start event** is used to depict the start of a process. Start events are depicted with a single outline
- An **Intermediate event** is used to depict an event that occurs within a process that will affect, but does not terminate it. An intermediate event has the ability to catch (restart) or throw (pause) the sequence of activities within the process. Intermediate events are depicted with two concentric outlines.
- An **End event** is used to depict the end of a process. Multiple end events can be used if the model requires it. They define the result of the sequence of activities within the process. End events are depicted with a bold outline.

The text description on events is always written to depict the state of the trigger that has started, interrupted or ended the process and is written as Noun Verb (past tense) e.g. ‘Letter sent’

Element Name	Element Notation	Element Description
None event		Represent events that are not defined, still indicate that something has been triggered at the start point, within or at the end of the process. A none start event is always used in a sub-process and an intermediate none event is always represented as a catch event.
Message event		Represent information or communication triggering an event within a process. A message can start, be received within or sent from a process.

		Catching (receive) messages are depicted as unfilled envelopes and throwing (send) are depicted as filled envelopes. Examples would include SMS, lodged forms or phone call,
Timer event		Represent a delay within the process and can be used as cyclic timer events, points in time, time spans or timeouts.
Signal event		Represent synchronized and exchanged indicators between different parts of the process. They are relatively undirected. Anyone who receives the signal and wants to react may do so. A signal thrown can be caught multiple times. Catching (receive) signals are depicted as unfilled triangles and throwing (send) signals are depicted as filled triangles.
Boundary Interrupting event -		Represents an event that can be triggered by a message, timer, signal, or escalation when an activity is running. When an interrupting event is triggered, the activity is stopped and the flow out of the boundary event is taken.
Boundary Non Interrupting event –		When a non-interrupting event is triggered, the activity continues to run. The sequence flow out of the boundary event runs in parallel with the normal process flow.
Error event		An intermediate error event can only be attached to the boundary of an activity. Note that an error event always interrupts the activity to which it is attached. An error event isn't part of a known process unless specific mitigation is to be modelled.
Terminate event		Triggers the immediate end of the process. There can be more than one in a flow. If a process reaches this event, the entire process will be closed.

3.3 Activities (Function)

An activity is a generic term for work that is performed in a process. An activity can be a task or a series of tasks within a sub-process.

The text description on tasks and sub-processes is always written as Verb (present tense) Noun e.g. 'Update form'.

Element Name	Element Notation	Element Description
Manual task		A manual task is used to depict a single action which is performed manually. It is expected to be performed without the aid of any business process execution engine or any application.
User task		A user task is used to depict a single action which is performed using an application or system (e.g. SAP). (SAP synchronisation relevant). It is used when the work during the process cannot be broken down into a finer level within the flow.
Service task		A service task is an automated action that starts automatically when the sequence flow arrives. If a person has to click a button then it is a user task.
Sub-process (Marker)		A sub-process is a compound set of actions included within a process. It is compound given that the shape includes a set of tasks and events as a logical sequence as a process. The sub-process can be collapsed or expanded as required.
Loop (Marker)		A loop (Marker) shows that a task may loop for a defined amount of times (shown by an annotation or equivalent). A sub-process (Marker) and a loop (Marker) can be used together to create a looping sub-process. A loop shows that a task may loop for a defined amount of times. A loop task repeats until a defined condition either applies or ceases to apply
Call activity		A call activity is a package for a globally defined set of tasks or process reused in the current process. This means the task would not be detailed in these models as it is shared by various business functions An example is Collection of Proof of Identity for a customer is an identical process across multiple payment types, therefore a global process would be designed and a call to that activity or process would be made to demonstrate the task is detailed elsewhere. A call activity is drawn as a bold-line round-edge rectangle.

3.4 Gateways

A gateway is used to control the divergence and convergence of sequence flows in a process. It determines branching, forking, merging, and joining of paths. Internal markers indicate the type of behaviour. Gateways are sometimes referred to as 'splits' or 'joins'.

Element Name	Element Notation	Element Description
Exclusive (OR) gateway		An exclusive (OR) gateway is used to identify a decision where two or more outgoing sequence flows are available, but only one flow can be taken. An exclusive (OR) gateway must have conditions labelled for each branch. An exclusive (OR) gateway can also be used for convergence. Convergence gateways are used to merge multiple flow lines back into one outgoing flow line.
Parallel (AND) gateway		A parallel (AND) gateway is used to identify where multiple flow paths must be taken. The parallel (AND) gateway is also used to synchronize (wait for) parallel paths to reconverge.
Inclusive (AND/OR) gateway		An inclusive (AND/OR) gateway is a branch in the process that may trigger more than one out-going path, based on conditions. An inclusive (AND/OR) gateway must have conditions labelled for each branch. An inclusive (AND/OR) gateway can also be used for convergence.
Event-Based gateways		An event-based gateway is a branch in the process that has a path decided based on an event occurring. An event-based gateway must have an event following it on each branch.

3.5 Data

Element Name	Element Notation	Element Description
Data Object		Data objects provide insight into what information activities require to be performed and/or what they produce. Data objects can represent a singular data set or a collection of data sets and can be used as both input and output.
Data Store		Data stores are used to show where information is interacting with a database or system application. They save information precisely for this process. They are not application system type of element. They represent basic organizational data stores, repositories, or databases. Data stores are not compulsory, and are only necessary when further details are needed for a process. Data stores can be used as both input and output.

3.6 Connecting Elements

Element Name	Element Notation	Element Description
Sequence flow		A sequence flow is used to show the order that actions are performed within a process. The main flow of processes must always flow from left to right. A sequence flow is never used when indicating process flow between pools
Association		A data association is used to link elements to data objects. They have an arrowhead showing the data flow is directional and lacking when the association is reliant.
Message flow		A message flow is used to show the flow of communication between two participants. It is depicted from an event or activity in one pool to another. In the case of sending or receiving messages from a whitebox to a blackbox pool the message flow can be drawn to the outer edge of the pool.

3.7 Artefacts

Artefacts are used to provide additional information about the process and to enhance the reader's understanding of the process. They are not used to depict any part of a process.

Element Name	Element Notation	Element Description
Group		A group artefact is a grouping of elements that are relative. This grouping does not affect the sequence flows within the group. The group name (why the elements are relative) appears on the model as the group label. The label is either at the top or the bottom of the group, and always on the inside of the grouping.
Text Annotation		A text annotation artefact is used to provide additional text information for the reader of a model. It does not affect the sequence flows of the process in anyway.

4 BPMN 2.0 Quality Recommendations

4.1 Element rules and recommendations

The rules around element use are extremely crucial to consistency and understanding. Each rule forms the basis of support and quality assurance checks with the department.

Each element has a set of rules outlining the following key information

- What the element must connect to syntactically i.e. a task MUST belong to a swimlane to pass quality check
- What the element must not connect to syntactically – i.e. a task MUST NOT belong directly to a pool (this is because a pool MUST contain swimlanes)
- What the element can do to ensure semantic quality but is not enforced i.e. A message flow can connect an intermediate event to an intermediate event in a different pool. (this is because it can also be used to connect to the boundary of a pool rather than directly to another event)

The attached files in Appendix 6.1 contain the complete set of rules.

4.2 Attributes for ARIS object

An ARIS object refers to a BPMN 2.0 element used in the modelling tool and represents an individual entity within the repository. Attributes of an ARIS object or model provide context and ensure uniqueness. Some attributes are mandatory such as name while others are recommended to support other modellers who may wish to use the ARIS object in their own models. There are additional attributes available in ARIS which can be used or are system generated which provide additional information or auditing, such as creator or last change. These are not detailed in this document.

Many ARIS objects such as sequence flows or events only require additional attributes in unique instances; the rules should be referred to in conjunction with the recommended attributes.

4.2.1 Attributes for Models

Model Type	Attribute Type	Requirement
BPMN collaboration diagram	Name	Mandatory
	Description/Definition	Mandatory
	Full name	Mandatory
	Person responsible	Mandatory
	Hierarchy	Recommended
	BPM Project	Recommended
	SAP Model Type	Mandatory (* this must be process)
BPMN process diagram	Name	Mandatory
	Description/Definition	Mandatory
	Full name	Mandatory
	Person responsible	Mandatory
	Hierarchy	Recommended
	BPM Project	Recommended

4.2.2 Attributes for ARIS objects

ARIS Object Type	Attribute Type	Requirement
All tasks, Sub-processes & Call activities	Name	Mandatory
	SAP function type	Mandatory (must be process step)
	Description	Recommended if requiring further context
	Business Owner	Recommended
Participant (Pool) & Lane	Name	Mandatory
	Business Owner	Mandatory
	Description/Definition	Mandatory
Events	Name	Recommended
Group	Name	Mandatory
	Description/Definition	Recommended
Data Object & Data Store	Name	Mandatory
	Business Owner	Mandatory
	Description/Definition	Mandatory
Sequence Flow	Condition Expression	Mandatory (when coming from an exclusive or inclusive gateway)

4.3 Naming Conventions

4.3.1 Naming conventions for Processes, Tasks, Sub-processes

- Need to specify 'what' is being done
- Begin with a verb followed by business name and possibly an adjective (e.g. Issue information pack, Reschedule appointment)
- Description should be made of 3-5 words

**The list below shows verbs that can be used in task names.
NOTE - This list is a guide only and is not an exhaustive list.**

accept	clarify	determine	fulfil	notify	request
administer	collate	develop	identify	order	schedule
alter	communicate	direct	initiate	oversee	store
analyse	conduct	disburse	instruct	perform	train
apply	control	distribute	issue	pilot	transform
approve	convert	establish	manipulate	prepare	update
assess	coordinate	evaluate	manoeuvre	record	validate
carry out	create	facilitate	move	refine	verify
check	designate	finalise	negotiate	regulate	request

**The list below shows generic verb options to be AVOIDED in task names.
NOTE - This list is a guide only and is not an exhaustive list.**

action	decision	handle	manage	read	type
click	download	fix	post	run	upload
choose	enter	input	process	transmit	write

4.3.2 Naming conventions for Events

Events depict the state change or trigger within a process. The name of the event must be simple and provide context for the state change in a process.

- **For start/intermediate message events:** indicate what is being sent or received (e.g. Claim received)
- **For end message events:** indicate what is being sent (e.g. Q002 Sent)
- **For timer events:** indicate frequency or deadline (e.g. on Mondays, Weekly, Invoice Due, 23/10/2010)
- **Event names (except for timer events):** noun or noun prefixed by a qualifier and end with a participle tense verb (e.g. Urgent Order Finalised)

2. Document Information

2.1 Introduction

Business Process Management (BPM) is a management discipline that treats business processes as assets that directly improve enterprise performance by driving operational excellence and business agility¹. Business Process Management focuses on the optimum management of an organisation's processes to meet the organisation's strategic goals. A strategic approach to business process management focuses on the end to end processes for an organisation from the customer or client's perspective, enabling the organisation to deliver against its outcomes and improve its services.

The primary goal of Business Process Modelling and Notation (BPMN) is to provide a notation that is readily understandable by all business users. BPMN is a common language to bridge the gap between business process design and process implementation.

BPMN 2.0 specification will assist DHS in conducting Business Process Management through the provision of a standardised notation for all process models. BPMN is a world leading notation and is currently being used by a large number of government agencies and private organisations. BPMN is managed by the Object Management Group which provides a specification on how BPMN is used. BPMN is a process centric notation that is focused on business activities and not the technical solutions that may be implemented.

2.2 Purpose

The purpose of this document is to define the standards for business process modelling within the department to create modelling consistency.

This is Part B of the DHS BPM Standards & Guidelines. This volume contains **guidelines** for modelling in the BPMN 2.0 modelling language. Part A, the first volume, contains **standards and rules** on how to use each element of BPMN.

The elements referenced in this document are a sub-set of approved elements extracted from the Object Management Group standards.

2.3 Target Audience

The target audience of this document is:-

- Business Process Modellers / Designers
- Enterprise Architects
- Business Analysts
- System Analysts

¹ Source: Gartner

2.4 Publishing Standards

BPMN 2.0 Process and Collaboration Diagrams are to include the following mandatory attributes as a minimum:-

- Unique process name
- Description/Definition
- Author
- Person responsible – Business Owner approval (Name / Title / Date)
- Standard fonts and font sizes
- Model status

3. Process Model Element guidelines

It is expected that most models within DHS will be designed using the following two formats:

- BPMN 2.0 Process Diagram
- BPMN 2.0 Collaboration Diagram

3.1 Title

Alignment:

- Align title box on the far left. Do not leave a space.
- Leave one grid row between the title box and the pool below. *Note:* grid size left at default. Refer Figure 1.
- Model to be saved at 100% magnification

Figure 1 - Best practice

Sizing:

- Do not shrink title box. Leave at default size. Where the name is too long to fit on one line at the default size, then adjust the title over two lines (achieved by adjusting on model properties) Refer Figure 2.

Naming:

- Only use acronyms after the full name in the model title.
- Use title case when naming models (i.e a capital letter for the start of every significant word).
- The use of a verb then object is considered best practice e.g. Assess Specific claim
- The principle words in a title are all words which are not:
 - Articles (a, an, the)
 - Conjunctions (and, but, or)
 - Prepositions (on, in, with)
- Where the name is too long to fit on one line at the default size, then adjust the title over two lines (achieved by adjusting the 'Name' by right clicking on the model and selecting properties) Refer Figure 2.

Figure 2 - Best practice

General:

- Where the length of the pool(s) is/are greater than the length of the title box, the title box will remain at the default size. It will not be lengthened to match the length of the pool(s).
- Where the length of the pool(s) is/are less than the length of the title, make pool the same length as the title box. Refer Figure 3

Figure 3 - Best practice – pools same length

Figure 4 – Incorrect – pools less than length of title bar

3.2 Pools/Lanes

Alignment: (Refer Figure 5)

- Leave one grid row between each pool
- Model to be saved at 100% magnification. *Note:* grid size left at default.
- Align pool on the far left. Do not leave a space. All pools must be the same length
- Lanes are not required for black boxes, where a pool can be left blank if no process steps are known.

Figure 5 - Best practice

Sizing:

- The height of black boxes should be minimised. Pool names must display in full (not as shown in Figure 7). As a general rule, Customer/Third Party black boxes should be 4 grid squares in height.
- Where possible keep all Pool Names to the same number of text lines, with best practice being a maximum of two text lines. Refer Figure 6 versus Figure 8.

Figure 6 - Best practice- maximum of 2 lines, name displayed in full

Figure 7 - Incorrect - names must be displayed in full

Figure 8 - Incorrect - more than 2 lines

Naming:

- Select from the library where possible use an existing object that already exist in the library/database

- Always use acronyms (where a recognised acronym exists) after the full description. Refer Figure 9.
- Use title case when naming pools
- Lane name should consist of the job location (e.g. Smart Centre, Service Centre) where relevant followed by job title e.g. Smart Centre Service Officer, else Service Officer if the process is not limited to a specific 'job location'
- For the Department of Human Services, the best practice is to include service tasks within a human lane rather than incorporate an additional system lane. Refer Figure

10 unless a task is only performed by a system e.g. a task that is run on a pre-determined timeframe and is system generated.

Figure 9 – use acronyms following full name

Figure 10

3.3 Events

Start Events

Alignment:

- Place the start event vertically at top left within the pool where possible
- Where there are multiple start events, distribute them vertically where possible. Refer Figure 11. However, instances of notification can be collected as one start event, with an annotation inserted for clarification. Refer Figure 12.
- Vertical Alignment. Start events should be vertically aligned where appropriate. However start events do not need to be vertically aligned:
 - Where message flows will cross through another start event
 - In a scenario as demonstrated in Figure 13 where the bottom start event is centre aligned with the task above. Aligning the start events looks unbalanced. Refer Figure 14.

Figure 11 - Best practice

Figure 12 - Best practice

Figure 13 - Best practice – centre align subsequent start events with task above

Figure 14 - incorrect - looks unbalanced, annotation text across start event name

General:

- There are three approved start events, being none, message and timer. Refer Figure 15.

Figure 15

Naming:

- Events (except timer events) should be named as noun (business object) then verb (past tense) e.g. Q002 letter sent.
- Timer events indicate frequency or deadline (Fridays, fortnightly, 21 days, 05/12/2014).
- Events should be named using sentence case
- Names should be succinct
- Names should not spread over a more than two lines (where a name goes over more than two lines consideration should be given to whether the name is succinct).
- Names should be below the event symbol. In the instance where a message flow crosses the event name, then the name should be moved above the event.
- Names may appear to replicate associated tasks. Where a task is completed and a resulting event occurs then we will model both elements. Refer Figures 16.
- Intermediate events need not be used at all times to depict message flows to another pool. Message flows may be associated directly with a task. Refer Figure 18.
- Examples of event usage can be seen in Figures 19 and 20.

Figure 16 - Best practice

Figure 17 - incorrect (event is redundant)

Figure 18 - Correct. Task with message flow

Figure 19 - Examples of event usage

Figure 20 - Examples of event usage

Gateways

General:

- Multiple pathways can join/rejoin a single gateway, with multiple flows in/one out or one in/multiple out. When multiple flows are in place, it is best to co-locate the point of entry or exit of the gateway. Refer Figures 21 and 22.
- As a rule of thumb gateways work in pairs e.g. exclusive split/join, parallel split/join. Refer Figure 23
- Gateways must not have multiple entry and multiple exit points. Refer Figure 24.

Figure 21 - Best practice - multiple splits emanate from the same point on the gateway

Figure 22 - Technically correct but poor aesthetics

Figure 23 - Correct split and join exclusive gateways

Figure 24 - Incorrect

Parallel Gateway

- Where there are two flows out of a parallel gateway, they should exit from the top and bottom of the gateway where possible. Refer Figure 25.
- Where there are three or more flows out of a parallel gateway, they should exit from the top, bottom or middle points of the gateway. Refer Figure 27.
- Any number of sequence flows can be joined into a single parallel gateway. Refer Figure 27.

Figure 25 - Best practice for parallel gateway exits

Figure 26 - Incorrect style

Figure 27 - Best practice for splitting and joining multiple sequence flows

Exclusive Gateways

- Where there are two flows out of an exclusive gateway, and one leads to a task and the other to an exclusive gateway, the best practice is to have the flows exiting from the middle and bottom of the original gateway. Refer Figure 28.
- Where there are two flows out of an exclusive gateway, and both lead to another task, they should exit from the middle and bottom of the gateway. Refer Figure 29.

Figure 28 – Best practice

Figure 29 - Correct exits from gateway

Event Based Gateways

- An event-based gateway represents an exclusive choice based on the event that occurs first. They are always followed by catching events or receive tasks. Refer Figure 30

Figure 30 - Event based gateways

3.4 Activities

Task types and object size:

- Task types should always be used, except for Call and Sub-processes'
- Default size from symbol pallet (do not alter object size)

Figure 31 - A manual, service, and user task type

Alignment:

- Activities should align in a linear fashion preferably extending across and down. Refer Figure 32.

Figure 32 - Best practice for activities alignment using an exclusive gateway

Figure 33 - Incorrect style

Naming:

- Task names should be kept between 3 – 5 words and definitely no more than 7 words
- Consideration should be given to using text annotation to provide clarity rather than expanding the task name
- All words in the task name should display. Refer Figure 34.
- Need to specify “what” is being done, thus indicating the objective or outcome
- The convention is verb (present tense) followed by object e.g. Send letter.

Figure 34 - Ellipsis indicates that text is omitted from view

- ALWAYS check the library before creating a new task. Type the name, or the start of the name, and select the Definition selection button as per figures 35 and 36
- If there are objects with the same name in the library they will show up in the ‘Select object’ pop up box, as per figure 37.

Figure 35 - Definition selection button

Figure 36

Figure 37 - Select the object you wish to reuse

- Sometimes objects may be named slightly differently and therefore not show up in the normal search. Before creating a new object use a wildcard search to double check.
- Using an asterisk (*) before a word will search for all objects that have the word in their name, as per figure 38

Figure 38

- Using an asterisk (*) after a word will search for objects that start with that word, as per figure 39

Figure 39

General:

- A good rule of thumb is that a process model should include no more than 30 elements. The use of sub-processes (refer Figures 40 – 42), and/or calls activities, (refer Figure 43), should be incorporated when models extend beyond this suggested limit. Sub-process should also be considered when there are 5 or more consecutive tasks with no decision points.

Sub-Processes

- Follows the same guidelines for other activities
- When initially created the sub-process will look like the example in figure 40
- After QA has been completed the sub-process activity will be converted to the same size and shape as other activities

Figure 40 - How a sub-process will look when first created

Figure 41 - How a sub-process should look after QA

- When decomposing and then recomposing a sub-process there will be some alignment issues as per figure 42
- To avoid this use Undo (CTRL+Z) to recompose a sub-process

Figure 42 - The result when you decompose a sub process. Best to use undo (CTRL+Z) to recompose

Call activity

- Follows the same guidelines as per Activities section 4.4 above

Figure 43 – A call activity (used in “Scan & Attach”) is a wrapper for a globally defined task or process reused in the current process

3.5 Connecting Objects

Message Flows:

General:

- Message flows should show communication between two participants
- It is not necessary to show every interaction if this will clutter the model
- Where possible, message flows should not flow over message event names. Refer Figure 45. It is best to position pools to avoid this. Where it is not practicable to move a pool, then position the text to avoid clashing with a message flow. Refer Figure 46.
- Message flows may exit from and return to tasks when highlighting real time discussions. Refer Figure 47.
- Message flows may exit from a task to indicate information being provided. Refer Figure 48.

Figure 44 - Best practice

Figure 45 – Incorrect style

Figure 46 - correct style

Figure 47 - Message flows with task

Figure 48 - Message flows outgoing from task

Sequence flows:

- Have no name except for conditional flows
- Sequence flows should not cross other sequence flows or message flows
- Sequence flows should flow from the right of an activity. Refer Figure 50

Figure 49

Figure 50

Condition expressions should:

- Be succinct and non-repetitive. For example, there is no need to repeat the preceding task.
- Named using sentence case
- Be placed above the relevant sequence flow OR, where the sequence flow is vertical, to the right of the sequence flow. They should also be centred on the flow and not on the flow. Refer Figure 51.
- Where the flow is a right angle, the condition should be placed above the horizontal extension. Refer Figure 52.
- While not replicating the task objective, the naming of condition expressions should provide clear reasons for process progression. Refer Figure 53.
- Should be horizontally aligned where relevant. Refer Figure 54

Figure 51 - Best practice condition alignment

Figure 52 - Use horizontal

Figure 53 - Clarity of process progression

Figure 54 - conditions aligned

3.6 Text Annotations

Alignment: (Refer Figure 55)

- Place text annotations in the same position relative to the object they are attached to.
- Annotation should reside in the same pool/lane as the objects they are attached to.
- The association connector must be to the element they refer to.

Naming:

- All text annotations should be written in sentence case

Figure 55 - Annotation placement and connections

3.7 Object Symmetry

Symmetric structures increase understanding of BPM process models for both experienced and inexperienced users.

Objects should:

- Be aligned vertically and horizontally. Refer Figure 56.
- Be equally distributed horizontally. Refer Figure 57.
- Be equally distributed vertically. Refer Figure 56.
- Be positioned to avoid crossing flows. Refer Figure 58.

Figure 56 - vertically and horizontally aligned

Figure 57 - distributed horizontally

Figure 58 – Activities distributed vertically and events positioned to avoid crossing flow

4. Appendix

4.1 Modelling glossary

Term	Explanation
Catch	Anything that enters a process from another source. For example, a form filled in by a customer may start a process when it is 'caught'. A catch Element is always light in colour.
Object	Any icon, symbol or text placed on a process model.
Join	When a process flow is converged from 2 or more paths by a gateway.
Participant	Any entity responsible for a part of a process at a pool level.
Split	When a process flow is broken into 2 or more paths by a gateway.
Throw	Anything that leaves a process to another source. For example, a letter sent to a customer may end a process when it is 'thrown'. A throw Element is always dark in colour.

Part 2: BPM Strategic Plan 2015-2017

Australian Government
Department of Human Services

Business Process Management Centre of Excellence

Strategic Plan 2015-2017

humanservices.gov.au

"Australians increasingly expect that the delivery of government programs and services should be simple, seamless and connected. Implicit in this expectation is that government business processes will be managed appropriately and that agencies will work together constructively in the search for innovative solutions to complex issues."

Department of Finance "Business Process Interoperability Framework"

"The performance of any organisation hinges on its business processes."

Dr Michael Rosemann, Professor and Head of the Information Systems School, Science and Engineering Faculty, Queensland University of Technology, Brisbane, Australia. QUT's Dr Rosemann the author/editor of seven books, more than 220 refereed papers, Editorial Board member of ten international journals and co-inventor of two US patents.

"The real focus moving forward is getting organizations to reflect on the customer interaction and engagement paradigm. Organizations have to flip to outside-in to really understand how to shape the business processes and to develop stronger customer centric interaction and engagement models."

Stuart Chandler, bpm.com "How Will the Proliferation of Mobile Devices Impact BPM?" forum thread reply Oct 2014
Chandler is Vice President - BPM Practice, Virtusa, a global information technology (IT) services company providing IT consulting, technology and outsourcing services. Stuart has over 18 years of experience in deploying Business Process Management (BPM) solutions in large Financial, Insurance and Healthcare organizations.

"More and more organizations realize that process improvement can never reach its full potential if it is stuck in isolated departments and accessible by a few selected stakeholders. To unleash process power it is essential to bring people, processes and technology together in a sustainable Enterprise BPM program."

Software AG, "Intelligent Guide to Enterprise BPM". Software AG helps organizations achieve their business objectives faster. The company's big data, integration and business process technologies enable customers to drive operational efficiency, modernize their systems and optimize processes for smarter decisions and better service. Building on over 40 years of customer-centric innovation, the company is ranked as a "leader" in more than a dozen market categories, fueled by core product families Adabas-Natural, Alfabet, Apama, ARIS, Terracotta, webMethods and Software AG Live.

Background

Message from the Director

Over the coming years the department will deliver a number of significant initiatives to simplify processes, make welfare more accessible and affordable, and to replace aging ICT infrastructure. This transformation will impact many of the department's business processes and the way the department delivers its services to the Australian public. Therefore, now is the perfect time to specifically direct attention to improving the Business Process Management capabilities within the department. To date, the department has toiled in the Business Process Management arena with varying levels of success.

The formulation and formalisation of the Business Process Management Centre of Excellence will enable the development of necessary skills and capabilities to achieve the department's transformation. This strategic plan provides a high level view of short term goals against the backdrop of departmental strategy, with our future path based on industry best practice. It is founded on the following four key components:

- An initial component is to establish a process hierarchy, align the process architecture with strategic direction and develop appropriate governance arrangements with our identified stakeholders.
- The second component is a strategic improvement to the department's Business Process Management capabilities by undertaking the first Business Process Management maturity assessment and utilising the learnings from this to develop our future path.
- The third key component of this plan is to deliver an extensive training program across the business so that the basic concepts and benefits of Business Process Management can be delivered and support the practice of process modelling throughout the department.
- The fourth critical component is to ensure that the Business Process Management tools are fit-for-purpose and configured to support the Business Process Management initiatives.

While the strategic plan establishes a path for stronger and more strategic capabilities in the long term, the Business Process Management Centre of Excellence is keenly aware that it needs to provide observable value to the department now. To this end the Business Process Management Centre of Excellence has over the last year invested heavily in staff development and in particular in creating a core skill set around process improvement, process modelling and value driven business process management and the tools that support them. This has enabled the Business Process Management Centre of Excellence to be in position to realise immediate and ongoing benefits for the department through the support of in-flight projects in discovery, analysis, re-design and documentation of processes.

Director
Business Process Management Centre of Excellence Team

The Case for Enterprise Business Process Management – Strategic Plan Formulation

Establishing a departmentally endorsed Business Process Management (BPM) area will contribute to a more effective and efficient way of working, with an increased customer focus and performance gains.

It will also improve the visibility of key processes and ultimately, lead to greater returns on BPM investments in the form of improved operational clarity, agility, compliance, quality and efficiency as well as external networks with market partners and internal integration.

The comprehensibility that will be realised from establishing enterprise business process management practices will provide substantial visibility into how the department operates, performs, delivers, produces and complies with legislative requirements. This insight will enable realisation of the strategic vision and mission, the visibility enabling high quality commitment delivery aligned with long term vision.

Enterprise Business Process Management is important.

Process

- Processes can define, support and improve the department to achieve strategic objectives.

Process transformation

- In a continuously changing environment, processes of impact need to be transformed.

Process management

- Processes are assets which require management to succeed.

In the pursuit of implementing the Business Process Management (BPM) strategy it is important to understand that:

Establishing effective Business Process Management within an organisation will have significant impact and requires organisational and cultural change.

Service delivery owners should exploit the beneficial support of Business Process Experts who are proficient in applied concepts and methodologies.

Business Process Management is not a separate function or activity, but is intrinsically intertwined within the business as process is not just something the business does, process *is* the business.

The Case for Enterprise Business Process Management - Strategic Alignment with DHS Strategic Framework

Understanding an organisation's process capability allows informed decisions to be in relation to how processes best contribute to strategic goals and objectives. It is recognised by BPM practitioners that integrating functions and processes so they are in alignment with overall strategy enables operating decisions to be linked to strategic direction and this in turn assists with performance improvement.

The BPM CoE have worked to ensure the Business Process Management CoE Strategic Plan 2015-17 aligns with not only the DHS Strategic Plan 2015-2019 but have investigated and identified other linkages as detailed in the diagram below.

Implementing the Business Process Management Strategy

To date, facilitating requirements elicitation, developing project specific process models and undertaking process optimisation with limitations while involving stakeholders has been the Business Process Management focus.

The integration of the implementation phases allows BPM to fulfil a greater role, holistically managing the process of Business Process Management throughout the Department with the following four cyclical phases:

1. Process Strategy

- Design a high level strategy for BPM that can be embedded in the department's strategy
- Develop a communication plan that includes all key stakeholders
- Promote and market BPM within the department

2. Process Design

- Justify and align architecture
- Adopt an innovative design approach
- Define value creation
- Ratify vision and goals
- Define risks and treatments
- Establish BPM governance
- Communicate roles and expectations aligned with strategy to stakeholders
- Analyse and identify benefits

3. Process Implementation

- Implement the most beneficial innovative plan designed in the previous stage

4. Process Controlling

- Review and optimise
- Realise the value
- Evaluate the benefits of the previous stage
- Identify issues and establish better practice from lessons learned
- Define a process structure that enables a sustainable framework to continuously improve agile processes
- Embed process

Alignment with Department strategy

A critical imperative in the Business Process Management (BPM) Centre of Excellence (COE) strategic plan is that there is alignment to the strategic priorities of the department as depicted in the Department of Human Services Strategic Plan 2015 – 2019.

Government outcomes, customer outcomes

Customer-focused business processes are flexible enough to provide rapid responses to change, uncomplicated and easily understandable to enable quick adoption.

Creativity and innovation are fostered through empowering our staff with a sense of ownership of their business processes.

Awareness of potential impacts to the process landscape is achieved through environmental observation.

Capable and engaged people

Train and support our people in use and methodology so they can build and deliver our services.

Engage closely with stakeholders during the BPM lifecycle ensuring high acceptance and quantitative satisfaction.

Examine work functions across the department to identify the responsibilities, support process modelling, provide procedures, identify improvements and ensure these are always aligned with departmental strategy.

A strong collaborative approach

New processes will be developed in collaboration with the community and customers.

During the development of our services, we identify and seek input from relevant specialist sources, including service providers, practitioners and domain experts.

Explore and embrace the benefits of digital social collaboration.

Service transformation

Our services will enable the architectural framework which will, in turn, support the department's stakeholders in development of whole-of-government digital service delivery.

Facilitate seamless transformation activities through increasing standardisation while providing a shared understanding of end to end processes.

Enhance automation and execution via holistic continuous process management.

Vision

The vision and overall goal for the Business Process Management Strategy

Over the next three years the focus of the Business Process Management (BPM) Centre of Excellence (COE) will transform the application of Business Process Management methodology from supportive process mapping to transformative BPM maturity.

2015

- Create a customer focused approach to process work, design and thinking.
- Increase departmental process awareness.
- Secure the support for governance framework and guidelines.
- Deliver BPM training inclusive of BPM information, notation and tools.

2017

- BPM CoE supports a process-centric design culture with a customer focus.
- Staff have access to a process view of the services they deliver.
- DHS adheres to a process governance structure and accompanying guidelines.
- Increase in departmental understanding and application of Business Process Management.

- Develop and seek executive endorsement of a Business Process Architecture (BPA).
- Create and maintain a process object library that aligns with the BPA.
- Distribute endorsed DHS BPM conventions and guidelines.
- Initial maturity assessment.
- Identify Process Owners.

- Business Process Architecture (BPA) is developed and maintained.
- A standardised governed set of DHS objects to support BPA.
- DHS BPM conventions and guidelines.
- Understanding of BPM Maturity.
- Active involvement of identified Process Owners.

- Publicised Process Models are easily accessible to staff.
- Development and endorsement of DHS BPM conventions and guidelines to support modelling and tool use.
- Creation of BPM access hub for staff.
- BPM CoE awareness promotion.
- Professional BPM support.

- Appropriate stakeholders can easily view process models.
- DHS Staff have access to a process governance structure.
- Knowledge is managed and is accessible
- DHS training material.
- BPM CoE mailbox is the single point of contact for BPM enquiries.

- Invest in the latest BPM technologies.
- New streamlined approach of process information lifecycle.
- Facilitation of Business Process information between Business and Information Communication Technology (ICT).
- Technical support for ARIS users.

- Operating in accordance with Whole of Government Common Operating Environment Policy (2010).
- Adopted streamlined approach to the process information lifecycle.
- Quality information is provided to ICT.
- ARIS CoE mailbox is the single point of contact for ARIS enquiries.

While the transformation takes place we will ensure our existing process design work continues to meet the needs of our stakeholders and we will communicate well to nurture stakeholder's confidence and skills in the tools and methodologies.

Business Process Management Strategic Goals

To reach our strategic vision there are four key facets.

Each of the four facets will be the basis for our work over the next three years.

People strategic goals

People - to bring staff along the BPM journey

Aims

- Creating a customer focused approach to process work, design and thinking in the department.
- Increase departmental process awareness in relation to services offered by the department.
- Secure the support of the senior executive in relation to adoption of a process governance framework and accompanying guidelines.
- Regular delivery of Business Process Management (BPM) training inclusive of BPM information, notation and tools.

Outcomes

- Business Process Management Centre of Excellence (BPM CoE) supports a process-centric design culture with a customer focus.
- Staff have access to a process view of the services they deliver.
- BPM CoE supports Department of Human Services (DHS) in adhering to a process governance structure and accompanying guidelines.
- Increase in departmental understanding and application of Business Process Management.

Measurement

- Increased usage of customer focussed Process Design.
- Number of responses to enquiries in relation to process views of services.
- Continued financial and Executive support for BPM CoE team.
- Number of attendees and percentage of post training positive feedback reflects an increased awareness of BPM.

Process strategic goals

Process - identification, management and optimisation of enterprise end to end

Aims

- Development and executive endorsement of a Business Process Architecture (BPA).
- Creation and ongoing maintenance of a process object library that aligns with the DHS Business Process Architecture.
- Distribution of endorsed DHS BPM conventions and guidelines to support the BPA.
- Undertake an initial BPM maturity assessment supported by annual reviews.
- Identification and allocation of relevant Process Owners.

Outcomes

- BPA is developed and maintained.
- A standardised governed set of DHS objects to support BPA and correct use within project environments.
- Endorsed BPA conventions and guidelines.
- DHS has a clear understanding of the BPM Maturity environment.
- Active involvement of identified Process Owners in relation to process approval.

Measurement

- Endorsed BPA.
- 100 percent of any Process Objects aligned to the BPA must pass strict Quality controls.
- Number of models and objects that comply with PA conventions.
- Incremental increase of BPM Maturity in relation to targeted areas.
- 100 percent of DHS processes required for Process Owner approval are first subjected to Quality Assurance.

Information strategic goals

Information - consistent, accurate, understandable, transparent and easily

Aims

- Publication of Process Models that are easily accessible to staff, with access restrictions where appropriate.
- Development and endorsement of DHS BPM conventions and guidelines to support modelling and tool use.
- Creating a consolidated BPM access point to facilitate staff having access to the latest BPM information and collaborate including published models and academic research.
- BPM CoE awareness through cross promotion of DHS complementary training packages.
- Provide professional support for BPM enquiries through the BPM mailbox.

Outcomes

- Applying a consistent release management to Business Process Models to ensure the appropriate stakeholders can easily view them.
- DHS Staff have access to a DHS view of the process governance structure and accompanying guidelines.
- The departmental knowledge of Business Process Management is accessible and reflects a consistent message.
- DHS training material that complements BPM content and links in with the BPM CoE training suite.
- BPM CoE mailbox is the single point of contact for BPM enquiries.

Measurement

- Regular publication of Business Process Models.
- Number of site hits on BPM CoE access points.
- Increased number of referrals from complementary DHS training packages.
- Mailbox enquiries meet relevant Service Level Agreements.

Technology strategic goals

Technology - innovative and efficient exploitation of technology as a business

Aims

- To invest in the latest BPM technologies to facilitate innovative process design.
- Creation and endorsement of a new streamlined approach of process information lifecycle between Business and Information Communication Technology (ICT).
- Facilitation of Business Process information between Business and Information Communication Technology (ICT).
- Establish documentation to provide on-site and virtual technical support to ARIS users.

Outcomes

- Usage and upgrade of BPM technologies are in accordance with Whole of Government Common Operating Environment Policy (2010).
- Usage of the new streamlined approach to the process information lifecycle is adopted by business teams.
- Information presented to ICT is of high quality and compliant with BPA.
- ARIS CoE mailbox is the single point of contact for ARIS enquiries.

Measurement

- Our BPM technologies are compliant with the Whole of Government Common Operating Environment Policy (2010).
- Greater acceptance of new streamlined process information lifecycle approach by ICT.
- Reduction of models that need manual intervention for QA adherence.
- Mailbox enquiries meet relevant Service Level Agreements.

Stakeholders

A strong collaborative approach

Internal Stakeholders

The implementation of this plan is dependent on a number of teams collaborating together. To date there has been a strong focus on multiple teams forging strong partnerships to ensure that suggestions and issues are documented, escalated and resolved.

The BPM CoE wishes to ensure:

- That users have the ability to access the support they seek.
- Relationships with our ICT colleagues remain healthy.
- Communication with internal stakeholders is open and effective.

This will facilitate the following outcomes:

- Users are supported and consulted in relation to improvements involving methodologies and tools.
- Determining if expectations in relation to performance levels of the modelling tools are met.
- Feedback is continuous and taken in to account when delivering strategies within this plan.

External Stakeholders

The department's transformation can only be successfully achieved with the outside assistance of those within the Business Process Management community.

The BPM CoE will undertake this engagement for the purpose of:

- Positioning the department firmly as a place of best practice within the government arena and local and international BPM communities.
- Accessing latest BPM thinking and practice from accredited experts.
- Strengthening our BPM in-house capability by collaborating with BPM professionals within government and also in industry.

The expected outcomes from external engagement are as follows:

- The department is viewed as a BPM leader within the Australian Government.
- The department will be seen to be working closely with industry, academia and accredited experts for exceptional educational alignment with latest research.

Strategic BPM Risks and Summary of Measurements

Strategic BPM Risks

Business process management adopts comprehensive strategic risk management, in line with the Department's Enterprise Risk Management framework. As such the risk management processes embedded into key organisational processes in connection with change management, post-event learning and assurance, identification, analysis and evaluation of risk will be consistently holistically applied.

- Lack of clarity at a BPM strategic level.
- Poor overall departmental knowledge of process oriented approaches.
- Lack of skill diversity in BPM practices.
- No improvement in the BPM Maturity assessment results in reduced executive confidence.
- Lack of well-defined responsibility and accountability for owned processes.
- Lack of methodological rigour from outside BPM team in relation to execution of BPM strategy and BPM governance.
- Limited BPM CoE expertise in relation to technology support as a result of staffing changes.
- Lack of defined business metrics and/or measurement protocols for assessing process management performance.

Summary of Measurements

Strategically linked outcomes, quantitative and qualitative measures will be used to review performance strategic priorities and assist in achieving the Strategic Plan. Our measurements will be a fundamental component of sustaining the change process and promoting business process management culture within the department.

Measurements include:

- Increased usage of customer focussed Process Design.
- Number of responses to enquiries in relation to process views of services.
- Continued financial and Executive support for BPM CoE team.
- Number of attendees and percentage of post training positive feedback reflects an increased awareness of BPM
- Endorsed BPA.
- 100 percent of any Process Objects aligned to the BPA must pass strict Quality controls.
- Number of models and objects that comply with PA conventions.
- Incremental increase of BPM Maturity in relation to targeted areas.
- 100 percent of DHS processes required for Process Owner approval are first subjected to Quality Assurance.
- Regular publication of Business Process Models.
- Number of site hits on BPM CoE access points.
- Increased number of referrals from complementary DHS training packages.
- Mailbox enquiries meet relevant Service Level Agreements.
- Our BPM technologies are compliant with the Whole of Government Common Operating Environment Policy (2010).
- Greater acceptance of new streamlined process information lifecycle approach by ICT.
- Reduction of models that need manual intervention for QA adherence.

Part 3: DHS's core service areas positioned across the current organisational structure

The current DHS organisation chart that illustrates DHS's structure and position occupancy is publicly available at <https://www.humanservices.gov.au/sites/default/files/04042016b-org-chart.pdf> (last accessed Feb 26th, 2017).

The figure below also depicts where the different teams working on BPM is located within this Organisational Structure (current as of Feb 26th 2017).

THIS CHART REFLECTS THE DEPARTMENT'S STRUCTURE AND POSITION OCCUPANCY EFFECTIVE 6 FEBRUARY 2017

◆ - SES Band 1 employee reporting directly to a Deputy Secretary.
 ♦ - Temporary role.
 Higher duties and temporary at-level arrangements are generally shown when the tenure is four weeks or more and are indicated in *italics*.

Part 4: Process Governance Standards 2015-2017

Business Process Management Process Governance Plan 2015/2017

Version: 1.1

1. Purpose

The Business Process Management Centre of Excellence Strategic Plan 2015 to 2017 describes the strategy and the strategic goals of the Business Process Management Centre of Excellence (BPM CoE) for the period 2015 to 2017. This document describes the process governance arrangements that will support the BPM CoE in executing that strategy and reaching those goals within that timeframe.

A business process is a sequence of interdependent and linked procedures which, at every stage, consume one or more resources such as employee time, energy, technology etc. and which convert inputs (data, time and effort) in to outputs. These outputs then serve as inputs for the next stage until a known goal or end result is reached (Business Dictionary).

BPM is a discipline. It is neither a business process improvement initiative nor a business process reengineering initiative although it encompasses both. It is a disciplined approach to the management of processes to enhance efficiency, effectiveness and agility for the department.

Efficiency reduces operational costs and effectiveness achieves, not only a corporate view, but enables the BPM CoE to influence the enhancement of services both internally and externally. Agility enables the department to be more responsive to changes arising from influences such as changing policy and new budget initiatives.

The governance arrangements described in this document are based on current goals and circumstances and will be reviewed each quarter to ensure they remain relevant.

2. Business Process Management Governance

The role of Process Governance is to fill the gap between strategy and execution, to help align the two and as a consequence contribute to an increase in productivity which in turn will generate both public value and value to the department in the form of more effective resource usage and less duplication of effort with streamlined services and enhanced processes. It provides the department with visibility into, and oversight of, the relationships and interdependencies that connect the business and IT with a common understanding of Business Process Management (BPM) across the department. Process Governance encompasses a number of areas in relation to BPM including standards, measurement, tasks, control and the evaluation of processes using an endorsed methodology. It also encompasses BPM technology and supporting

documentation to meet strategic goals and will encapsulate all aspects of the implementation of BPM across the department.

Effective BPM Governance reinforces the strategic alignment among process management activities and business priorities, clearly defines and enforces the accountabilities of each area of process governance and the accountabilities of each involved stakeholder and avoids redundancies related to BPM initiatives.

3. Building a Process Governance Model: Impacts

In order to build a sound Business Process Governance model it is necessary to not only understand the definition of process governance, but also to identify the major factors that may impact on implementing the model. These factors must be identified and considered so as to enable the generation of a result that not only contains those factors, but uses them in the most efficient and effective manner. The identified impacting factors are:

- **Organisational Design and Control Structures:** the department currently has a governance framework that embodies the department's commitment to effective governance. Process Governance is intended to work within this framework to develop a clear structure that identifies and empowers process owners and to enable the revitalisation of processes. It will, also, clearly define the way the process owners can act with authority in relation to processes, their scope of activities and expectations in relation to outcomes and performance measures.
- **Business Strategy:** impacts how the business process governance model will be constructed. Process Governance should align with the overall strategy of the department to ensure that the core processes of the department are considered when developing strategy. Currently this is hampered by the lack of a process architecture to identify and allocate core processes to be able to develop this alignment.
- **Value Chain / Macro-process:** this factor is the foundation for process management because it brings together the major cross-processes in the department and removes the siloes. The department is currently unable to quickly develop value chains as there is, firstly, no process architecture as stated above and secondly the lack of a mature repository of departmental endorsed objects and process models to support the architecture.
- **Departmental Policies and Guidelines:** these factors may be restrictive or driving, but they always steer organisational actions and could impact on a potential transition from functional alignment to process alignment. Current policies and guidelines have provided a robust and secure foundation for the management of individual projects and programmes. The integration of BPM within the overall departmental governance framework will expand this capability to allow a more strategic cross-functional oversight of the department's actions to unlock synergies between separate projects and programmes.
- **Change Management:** This factor raises awareness, manages impact, mitigates resistance, and helps improve adoption of BPM Governance. There is currently a mature change management framework within the department, however there is no change management plan dealing specifically with the implementation of BPM within the department. This will be developed in conjunction with the BPM maturity assessment and roadmap.
- **Existing process-oriented instruments:** are facilitating and enabling factors for construction of a Process Governance Model; The BPM CoE is developing a comprehensive set of process-orientated instruments which are described later in this document.
- **Process Maturity in the Organisation:** impacts on how processes are structured, standardised, documented, managed and improved. A process maturity assessment evaluates the overall effectiveness of the governance and management of processes. No formal BPM maturity assessment has been undertaken in the department to date and therefore a baseline analysis will occur in 2015.

4. Operationalising Business Process Management

The Business Process Management CoE is working towards implementation of Business Process Management throughout the department. There are six core elements required to be considered when implementing Business Process Management in an enterprise, namely; Strategy Alignment, Methods, Technology, Governance, People and Culture (Rosemann and vom Broche 2010). The two encompassing elements, Methods and Technology, are incorporated into every phase of the BPM lifecycle. Initial capability in the other four core elements, that is; Strategy Alignment, Governance, People and Culture however is required to be developed to support the implementation of effective and sustainable business process management throughout the process lifecycle (Malinova, Hribar & Mending 2015). Malinova et al represents the business process lifecycle with the following diagram:

As the capabilities within the department develop over the next two years the process governance structure will evolve to incorporate them. The process governance arrangements at the end of this period will be greatly expanded to demonstrate the maturing capability. The sphere of process governance will be influenced by decisions made within the department as to how BPM is to be implemented, with the focus on a process-centric approach with defined management of processes and away from a functional approach where processes are not continuously analysed and improved.

At present, the department’s organisational structure is still predominantly aligned to business functions. In some cases the business functions align naturally with a core process, however in most cases they do not. Therefore, for most core processes, there is no single person with oversight of the end-to-end process. Instead there are a number of business owners whose interests’ overlap with a number of core processes and therefore do not have oversight of the performance and improvement of the end-to-end process. Accordingly, the same aspects of an end-to-end process may be developed by multiple areas of the organisational structure which can result in similar end to end processes being developed which creates duplication and, at worse, different processes for what is essentially the same process.

An advantage of having process governance is that the role of the business owner, in a process-centric organisation, remains to represent the interest of their particular business function however they interact with core process managers who ensure the future business development is aligned with the departmental strategic view based on the core departmental end-to-end processes. The general transitional phases are shown in the diagram below (Mayer 2005).

The successful delivery of the goals under the strategic plan will ensure that the enterprise will have developed the following essential capabilities for all the six BPM elements.

Strategy Alignment

- Strategy and process capability
- Enterprise process architecture
- Process measures
- Process customers and stakeholders

Process Governance

- Process management decision making
- Process roles and responsibilities
- Process metrics and performance linkage
- Process related standards
- Process management compliance

People

- Process skills and expertise
- Process management knowledge
- Process education
- Process collaboration and communication
- Gather and document the department's tacit, explicit, and cultural process knowledge.

Culture

- Responsiveness to process change
- Process values and beliefs
- Process attitudes and behaviours
- Leadership attention to process

Methods

- Business Process Management Notation(BPMN)Conventions, Standards, Guidelines
- ARIS software: Quality assurance policy, Administration manual

Technology

- Implementation of ARIS 9.2
- Development of a process object library that supports the DHS Process Architecture

(Adapted from a table by Malinova et al)

The four Initial BPM elements will provide overarching support for the particular activities associated with the process lifecycle, whilst capability in the core elements of methods and technology will directly enable each phase, in particular:

Process Identification

- Identify processes to focus on
- Assess the strategic relevance of processes
- Prioritise processes
- Select process owners

Process Discovery

- Document as-is processes
- Assuring process modelling quality
- Developing a common understanding of as-is processes
- Set performance goals
- Assembling teams responsible for working on processes

Process Analysis

- Analyse as-is processes
- Identify issues with as-is processes
- Prioritise issues
- Select process for innovation

Process Redesign

- Identify possible remedies and solutions for process issues
- Propose to-be process
- Analyse and design

Process Monitoring and Controlling

- Monitor and redesign process
- Identify bottlenecks and errors
- Undertake minor corrective action
- Use process metrics.

Process Implementation

- Implement changes in process
- Implement IT system
- Manage organisation change

5. Business Process Management Governance Model

To ensure the foundation capabilities are successfully implemented a Business Process Management Governance Model is required.

5.1. Process Governance Roles and Responsibilities

The Business Process Management Centre of Excellence executes its departmental process governance roles and responsibilities through two distinct streams.

The Strategy Stream's role is concerned with evolution of the department to a process orientated, customer focussed organisation that is well placed to meet the external challenges and internal expectation within a whole of government framework.

The responsibilities of this stream for the 2015 -2017 period are:

- Developing and evolving the BPM CoE Service Offer
- Pursuing and developing a process analyst role within the department whose role is to specialise in process modelling
- Integration of BPM as a departmental discipline
- Working with internal and external partners, leveraging combined knowledge to mutual advantage (i.e. Business Process Improvement, Business Process Design, Business Architecture, Queensland University of Technology, other Government BPM teams, private sector delivery organisations)
- Selection and utilisation of an appropriate BPM Maturity Model to conduct a baseline maturity assessment and, from this, develop strategies to continually improve the departments overall BPM maturity rating
- The Financial Investment Committee (FIC) provides overarching advice to the Executive Committee in relation to all finance and investment related activities including proposals to implement process redesign opportunities. The Strategy Streams responsibilities cover identifying and documenting those opportunities for incorporation into specific proposals
- To be the team contact point for consultation with Enterprise Architecture in relation to the ongoing development of the DHS Business Service Model

The Capability Stream's role is to create operational capability to support the department's evolution to the future state described above and for the 2015-2017 period be responsible for:

- Implementation of the departmental Process Architecture
- Development and implementation of Modelling conventions
- Develop and implement a BPM Quality Assurance Framework aligned with the DHS Quality Framework
- Providing Quality Assurance of all new BPMN2.0 models that are developed
- Having a thorough understanding of industry frameworks and standards
- Educating as many business analysts as possible in BPMN 2.0 notation within ARIS
- Liaison with SAP ALM team to improve ARIS functionality
- Manage the ARIS CoE Support inbox for ARIS and technical related enquiries
- Production and delivery of process models and support of inflight projects
- Delivery of process and requirement workshops for as many in-flight projects as possible
- Requirements Management Framework specialists
- Review of existing processes for opportunities for improvement

5.2. Process Governance Standards

Process Governance in the context of Business Process Management is about creating and maintaining an environment of success for the department; it is concerned with making sure effective policies and procedures are established and enforced across the department. A crucial enabler of this is having a single source of guidelines and tools tailored to the scope of the BPM program and clearly defined metrics with which to measure success against established objectives (described in more detail below).

Process governance within the department, at this time, relates to narrowly scoped processes (i.e. at individual project levels), however the greatest value from BPM is found in optimising enterprise wide value chains and this is where a single source of process governance standards and tools becomes critical.

The department has a strong history of business process improvement at the individual project level. A process governance framework supported by a single source of process governance standards, tools, process architecture, methods and documentation will enable the department the realisation of the full benefits of enterprise wide BPM and long term success and development at an enterprise level.

Tools:

The department has, since integration in 2011, expended great effort and resources in developing two key enablers to the successful implementation of enterprise BPM, they are

1. A dominant stack of technologies in relation to ICT supporting infrastructure. The dominant stack includes:
 - SAP platform
 - Common Desktop Environment
 - A standard suite of Microsoft applications, and
 - A single telephony environment

This work continues and is a crucial enabler for the department to develop standardised enterprise wide end-to-end processes.

2. Defining an enterprise-wide business architecture. This current work builds on previous successful endeavours that have allowed the creation of the:
 - Australian Government Business Process Interoperability Framework
 - Australian Government Architecture
 - DHS Capability Framework
 - DHS Service Catalogues and
 - DHS Service Delivery Operating Model

It is of critical importance as it is the genesis of identifying the department's core processes and process architecture.

The defining of an enterprise-wide business architecture of itself is not sufficient to ensure success. There is also the need for the appropriate software to support a common language and process methodology across the department, to bridge the gap between business and technology and to provide a single repository of corporate knowledge in relation to business processes.

In 2013, after extensive investigation, the department identified and acquired ARIS as the software to support process methodology. This decision was in part due to the ability of ARIS to interact with SAP applications to facilitate the smooth transition between requirement gathering, design, testing and execution.

Process Architecture:

As previously stated, the department is currently developing its business architecture. This is a critical deliverable as it allows the department to link the high level overview of its business processes to the department's strategic objectives.

Once the overall business architecture is completed, it will be assessed in line with the Capability Architecture, Service Delivery Operating Model, Customer Service Catalogue and the Business Service Delivery Model to produce a Business Process Architecture to be incorporated within the ARIS repository. The repository, which integrates seamlessly with the department's SAP Solution Manager, is designed to house and manage its optimised business processes into the future.

Methods and Documentation:

The BPM CoE has worked with internal stakeholders to develop documentation, standards, guidelines and protocols to support business process management within DHS. These include the following:

- [Process Architecture](#) – this is required to enable positioning of departmental processes within an established hierarchy to facilitate re-use and remove redundancies. The Process Architecture is currently under development.
- [Business Process Model & Notation \(BPMN\) 2.0 DHS Conventions, Standards and guidelines](#)– BPMN2.0 is an international modelling language and was endorsed in 2012 as the modelling language for use within DHS. Current artefacts are:
 - Non-BPMN 2.0 Models
 - BPMN 2.0 Models
 - Objects
 - Operational Guide
- [ARIS CoE Quality Plan](#) - the ARIS repository is the keystone of the department's ability to have a complete view of the processes and their place within the process architecture. This ability is greatly diminished if the processes models are of poor quality. The BPM CoE acts as a gatekeeper to the repository ensuring that all models comply with both ARIS and BPM conventions and establishes policy, aligned with the DHS Quality Framework, to facilitate this.
- [BPM CoE Aris Administration Manual](#) – This document provides detailed regulations in relation to who can access ARIS, how models are stored within ARIS, reports that may be generated, filters that are to be applied to models. The manual ensures that ARIS is administered in a consistent way and aligned with best practice.

- **BPM CoE Training Manuals** – Training manuals are crucial to the development of a repository that is of value to the department. They provide a standardised approach to all aspects of the creation of the department process repository.
 - BPMN 2.0
 - ARIS Fundamentals
 - Advanced ARIS
 - ARIS Administration
- **BPM CoE Governance Risk Management Plan** – this plan captures the risks in relation to business process governance and uses the endorsed DHS risk management framework and processes.

Measurement:

It is a fundamental task for the successful and effective implementation of BPM Governance to continually monitor the performance of both the BPM CoE team and the department against the BPM strategic goals.

BPM Strategy is measured in three stages:

Gather

- Review current BPM strategy and identify potential gaps
- Collect strategic process information from all stakeholders
- Ensure no stakeholder's needs are overlooked
- Separate strategic goals from tactical requirements

Refine

- Clarify business goals
- Avoid leaving out implied/unstated goals
- Separate strategic goals from tactical requirements
- Prioritise competing business objectives

Align

- Secure senior executive buy in by involving them in the process
- Balance group and team needs with departmental needs from a process viewpoint
- Ensure all employees are aligned with clear goals and strategy

Planning and performance monitoring ensures that the department:

- achieves its objectives
- manages risks
- uses its resources in a responsible and accountable manner

The BPM CoE Strategic Plan 2015-2017 articulates the team's objectives and strategic priorities. The plan and its identified measures will be reviewed bi-annually and performance evaluated to ensure that the team adjusts as the environment changes.

Within the BPM CoE there is also a need to cover both qualitative and quantitative aspects of BPM governance and the current BPM CoE Strategic Plan 2015-2017 identifies these as:

Qualitative

- Increased usage of customer focussed Process Design
- Continued financial and Executive support for BPM CoE team
- Endorsed BPA
- Regular publication of Business Process Models
- Increased number of referrals from complementary DHS training packages
- Mailbox enquiries meet relevant Service Level Agreements
- Our BPM technologies are compliant with the Whole of Government Common Operating Environment Policy (2010)
- Greater acceptance of new streamlined process information lifecycle approach by ICT
- Mailbox enquiries meet relevant Service Level Agreements

Quantitative

- Number of responses to enquiries in relation to process views of services
- Number of attendees and percentage of post training positive feedback reflects an increased awareness of BPM
- 100 percent of any Process Objects aligned to the BPA must pass strict Quality controls
- Number of models and objects that comply with PA conventions
- Incremental increase of BPM Maturity in relation to targeted areas
- 100 percent of DHS processes required for Process Owner approval are first subjected to Quality Assurance
- Number of site hits on BPM CoE access points
- Reduction in number of models that need manual intervention for QA adherence

5.3. Process Governance Structure

Process governance is also concerned with organisational issues, such as ensuring that the program has appropriate roles assigned with necessary skills and authority to carry out their responsibilities.

5.3.1 National Manager Workload Management Branch (BPM Sponsor)

The success of the BPM process depends on the commitment at top management level to Business Process Management. The BPM Sponsor role is committed to driving BPM from a top-down management perspective.

5.3.2 BPM Steering Committee

The committee is responsible for setting, monitoring and directing BPM strategy of the business. The committee is chaired by the Head of Business Process Management and attended by the Head of BPM Capability and Head of BPM Strategy and the BPM sponsor.

Other attendees are:–

- SAP ALM
- National Manager Business Representation
- Enterprise Architecture

5.3.3 The BPM Centre of Excellence

The responsibilities of the BPM CoE are BPM leadership, implementing a regulatory framework for BPM, offering project support, providing training and communication and process governance. The BPM CoE is concerned with ensuring that the business strategies are followed and that the BPM methodologies, operational process discipline, and supporting technology are consistently applied. It provides support to the department in the form of resources, expertise and governance oversight to ensure the successful execution of BPM initiatives.

5.3.4 Head of Business Process Management (Chief Process Officer)

This role is performed by the Director of the BPM CoE. The director of BPM CoE supervises and manages all process management activities at a branch level and manages the team of Business Process Experts within the BPM CoE. This role provides leadership to the Head of Strategy and the Head of Capability and has overall responsibility for the BPM CoE tasks.

- **BPM Operations**
 - Identifies BPM capability gaps
 - Sets up and manages the BPM governance organisation
 - Defines roles, responsibilities, and accountabilities of the BPM organisation
- **BPM Methods and Tools**
 - Owns repository that houses process architecture
 - Accountable for BPM conventions and guidelines
- **BPM Delivery**
 - Defines and owns the BPM methodology to deliver various forms of process improvement projects; addresses all phases of the process lifecycle
 - Serves as an integrator between business units and processes distributed across them
- **BPM Transformation**
 - Positions and sells BPM and its value proposition across the organisation
 - Must be collaborative, innovative, and focused on value
 - Provides guidance and leadership to the BPM CoE and the broader BPM organisation
 - Initiates BPM communities
 - Organizes the necessary program and project management
 - Sets up people change management initiatives

5.3.5 Head of BPM Strategy

This role is performed by an Assistant Director within the BPM CoE. The role is responsible for the progression of the BPM process and their team provides the following competencies/services:

- Definition of, and obtaining agreement for, the BPM Strategy
- Managing and co-ordinating all BPM activities
- Designing the organisations Business Process Architecture
- BPM Project Support to the whole of the organisation
- Drafting and agreeing process related key performance indicators (KPIs)
- Communication and Internal marketing of BPM
- Forging external collaboration in order to further BPM maturity

5.3.6 Head of BPM Capability

This role is performed by an Assistant Director within the BPM CoE. The role is responsible for ensuring the department has the capability to support the BPM process from design to implementation, specifically their team provides the following competencies/services:

- Selecting and supporting the BPM tool
- Managing the process standardisation group
- Operating all process methods, quality controls and software tools
- Providing BPM training and support

5.3.7 Business Process Experts

The Business Process Experts work as internal process management consultants for organisation-wide business projects and are in charge of methodological excellence and the roll-out of BPM knowledge into all projects. The Business Process Experts are managed by the Head of BPM Capability.

Business Process Experts include:

- Process modellers
- Process designers
- Process workshop facilitators
- BPM trainers
- BPM Quality Assurance Assessors

The BPM CoE's Business Process Experts are situated within the Capability stream and are responsible to the Head of Capability and skilled in all of the above areas.

5.3.8 Business Strategy Analysts

The Business Strategy Analysts provide support to the Head of BPM Strategy and under their supervision provide research and analysis support including process architecture, BPM strategy and internal and external communication.

5.3.9 Business Owner

The Business owner owns a process and is responsible for the operating performance and continuous improvement of their processes. The activities of the Business Owner are:

- Process performance and improvement and
- Customer satisfaction

In particular they:

- Are informed about proposed changes to the Process and Governance structure
- Initiate improvements in the tool, process, steering mechanisms, and people
- Review integration issues between the various processes
- Promote the Service Management vision to board level / Senior Management
- Function as a point of escalation when required
- Approve and initiate training when required
- Schedule and attend meetings according to the Process and Governance Structure

5.3.10 Enterprise Architecture

Enterprise Architecture aligns the department's business and ICT capabilities in accordance with the organisation's overall strategy. It undertakes research, analysis, and consultation, as well as providing advice to senior technical staff and senior executives in the course of participating in the development of the department's ICT direction. The branch focuses on ICT standards and policies, architectural direction, strategic planning, software rationalisation, and special projects as required by the CIO.

5.3.11 SAP Application Lifecycle Management (ALM) Team

Responsible for the SAP ALM Project which is tasked to implement ALM Tools and the associated processes and governance. Project's outcomes:

- A robust and enterprise strength ALM tools implemented to enable and support ICT teams to deliver SAP business solutions effectively and efficiently (both SAP and non-SAP systems)
- Well defined ALM Tools Processes and Governance
- ALM Tools are implemented to automate critical processes and enable DHS to better manage its solutions in particular SAP solution management and implementation
- ICT Teams are trained and have sound knowledge, skills and understanding in using ALM Processes and Tools which will enable them to deliver solutions in effectively and efficiently

5.3.12 Business Process Design (BPD) Team

Part of the New Parents, Child Care and Program Improvement Branch and responsible for:

- development, design, and mapping of business processes
- identifying improvements in productivity through identifying common processes and business patterns

5.3.13 Business Process Improvement (BPI) team

Focuses on improving the way the department delivers its work to provide better service and value to the department's customers using the Lean methodology.

5.3.14 Digital Design and Integration Branch

Responsible for the design, development and integration of the department's digital transformation strategy, fostering new business development opportunities with Commonwealth/State governments and private sector organisation's and contributing to digital policy development, including managing the department's contribution to the e-government agenda. Developer of the department Business Services Model.

5.4. Process Governance Tasks

The following four strategic facets of focus have been identified within the BPM CoE Strategic Plan 2015-2017 supporting the strategic goals:

People – to bring staff along the BPM journey

Process – identification, management and optimisation of enterprise end to end processes

Information – consistent, accurate, understandable, transparent and easily accessible

Technology – innovative and efficient exploitation of technology as a business enabler

A responsibility assignment matrix which is also referred to as a RACI matrix, describes the participation by various roles in completing tasks or deliverables for a project or business process. It is especially useful in clarifying roles and responsibilities in cross-functional/departmental projects and processes.

This section describes the tasks associated with those facets of focus, the responsibilities and accountabilities relating to each. RACI charts are used to show:

- activities related to each of the four strategic facets of focus (rows)
- key stakeholders associated with those activities (column)
- their roles in relation to each activity
 - Responsible – Who is responsible for the execution of the task?
 - Accountable – Who is accountable for the tasks and signs off the work?
 - Consulted – Who are the subject matter experts who need to be consulted?
 - Informed – Who are the people who need to be updated of the progress?

5.4.1. People – to bring the staff along the BPM journey

	BPD Team	Chief Process Officer	NM WLMB	Business Owner	BPI Team	WLMB PMO	BPM Steering Committee	BPM Head of BPM Strategy	BPM Head of BPM Capability
Training staff in creating Business Process Management Notation 2.0 models	C	A	I	C	I	I	I	C	R
Training staff in in creating models in ARIS	C	A	I	C	I	I	I	C	R
Training staff in viewing Business Process Management Notation 2.0 models	C	A	I	C	I	I	I	C	R
Training staff in ARIS administration	C	A	I		I	I	I	C	R
Training Business owners in implementation of Business Process Management	C	A	I	C	I	I	I	C	R
Supporting end-to-end process modelling	C	A	I	C	I	I	I	C	R
Engaging senior executives to adopt a Process Governance framework		R	A				I	C	C
Informing staff as to the meaning and benefit of Business Process Management	C	A	I	I	I	I	I	R	R

5.4.2. Process – maturity, re-use and quality

	BPM Head of BPM Capability	BPM Head of BPM Strategy	BPM Steering Committee	Digital Design & Integration	Enterprise Architecture	Business Owner	NM WLMB	Chief Process Officer	BPD Team
Development of object library	R	C	I	I	I	C	I	A	C
Development of Process Architecture	C	C	I	C	A	C	I	R	C
Development of DHS modelling conventions and guidelines	R	C	I	I	I	C	I	A	C
Maturity Assessment	C	R	I	I	I		I	A	C

5.4.3. Information – to bridge the business/ICT divide

	BPM Head of BPM Capability	BPM Head of BPM Strategy	BPM Steering Committee	WLMB PMO	SAP ALM	Business Owner	NM WLMB	Chief Process Officer	BPD Team
Provision of Quality Assurance	R	C	I	I	C	C	I	A	C
Capture of business requirements through ARIS	R	C	I	I	C	C	I	A	C
Synchronization of ARIS and SolMan	C	C	I	I	R	C	I	A	C
Creation of BPM CoE Information sites	C	R	I	I	I	I	I	A	I
Informing staff as to the meaning and benefit of business process management	R	R	I	I	I	I	I	A	C

5.4.4. Technology – to utilise the latest BPM technologies

	Chief Process Officer	NM WLMB	Business Owner	SAP ALM	WLMB PMO	BPM Steering Committee	BPM Head of BPM Strategy	BPM Head of BPM Capability
Maintaining currency of ARIS suite	A	I	C	R	I	I	I	C
Provision of onsite and virtual ARIS support	A	I	C	C	I	I	I	R

5.5 Governance Controls

BPM CoE Road Map - The BPM CoE will develop a roadmap with milestones indicated to highlight the expected development of BPM within the department from its current state to the future state vision. The roadmap will form an important control mechanism in determining the level of compliance the BPM initiative has with the governance framework going forward. It will also provide a clear description of the evolving business value of BPM assets and the alignment of the future state to the department's strategic vision.

BPM CoE Maturity Assessment - The BPM CoE will select an appropriate maturity model to conduct an audit as to the current maturity level of the department. The initial audit will provide a baseline as to the department's maturity in relation to business process management. This will enable the department to set realistic goals to improve the maturity level and work towards the strategic goal of being a BPM leader within the federal government. Audits will thereafter be conducted periodically and the outcomes will influence the continual evaluation of BPM CoE artefacts such as the Strategic Plan to ensure they maintain currency and relevance as the department BPM maturity develops.

BPM CoE Change Management Plan – The department has only recently adopted ARIS as the tool and BPMN 2.0 as the language for recording the department's processes within the repository and therefore the current conventions, guidelines and administrative processes are being developed. As BPM Capability matures, new tools, methods and approaches will be able to be integrated. The BPM CoE Change Management Plan provides the controls to ensure that any changes made are thoroughly tested and implemented in a consistent manner across the department.

BPM CoE Quality Plan – Quality Management ensures consistency of a product, tool or service through Quality Assurance (QA) and Quality Control (QC) and these are two core principles adopted within the department. The BPM CoE Quality Plan has a focus on improving the process and techniques used to manage QA and perform QC on all objects, models and projects in ARIS. The quality control processes are the examination methods applied to provide feedback and ensure the end result adheres to the guidelines and standards defined.

5.6 Process Governance Goals

Governance goals are the alignment of strategies within the department and ensuring the goals outlined in the BPM CoE Strategic Plan align with the goals within the DHS Strategic Plan 2015-2019. With alignment of goals it is easier to manage processes and have clearly defined objectives communicated to stakeholders.

The goals in both plans should be aligned in relation to the management of processes as outlined in the business process lifecycle.

5.7 Process Governance Evaluation

The governance plan is a living document that will be regularly reviewed to ensure the BPM strategic goals are delivered and in particular that fundamental Business Process Management concepts are being maintained, including:

- Adequate consideration of reusability is taken when modelling processes
- Analysis is based on end-to-end processes, so that issues are resolved rather than transferred
- BPM goals and values are defined in a language understandable for BPM stakeholders
- All stakeholders are identified and engaged appropriately
- Goals and values continue to align with departmental strategy
- Resources and effort are sufficient to support implementation timeline

The maintenance of the governance plan is an ongoing function. In addition, formal bi annual reviews will be conducted either internally or externally.

5.8 Process Communication

The implementation of Business Process Management within the department is first and foremost a human endeavour. Regardless of the successful delivery of specific strategic goals Business Process Management cannot flourish unless every departmental officer understands and embraces the key aspects of the discipline.

For this reason communication is an essential element of the governance framework. It goes beyond the allocating of responsibility and accountabilities for specific activities related to the strategic goals as described in a preceding section (section 5.4). Instead it assumes that all departmental officers, teams and branches are considered potential stakeholders and are identified and analysed immediately to ensure the department as a whole is engaged from the outset and not only those immediately critical to delivery of specific goals. Communication also requires the development of strong mutually beneficial connections and collaborations with external organisations (called influencers and described in section 5.8.4 below) which again may not support specific immediate goals, but, will establish the foundation for outward-looking creativity and innovation to be entrenched as the department matures.

5.8.1 Stakeholders

Assessing stakeholder attitudes and influence helps in understanding the influences that different stakeholders may have and how this may affect the achievement of the BPM strategic goals. It also assists in identifying those groups or individuals who should be involved, and how the BPM CoE may

involve them. The analysis requires an assessment of the perceived interest of the stakeholder towards the goal or objective, and the type and level of influence (positive or negative) that a stakeholder may have in achieving the goal or objective. Stakeholders may influence activities in a range of different ways.

Key stakeholder: any stakeholder with significant influence on or significantly impacted by the work and where these interests and influence must be recognised if the work is to be successful

Stakeholder: any individual or group who has a vested interest in the outcome of work the BPM CoE team is undertaking.

The four areas in the matrix below (Figure 1.1) identify the four quadrants of BPM CoE stakeholder engagement. The matrix was developed within the team and will be updated as stakeholders move between or within quadrants. It is intended to be reviewed fortnightly as part of the BPM CoE team meeting. The contents of the quadrants are defined as:

Keep Satisfied

- engage & consult on interest areas – ensure needs and concerns are understood and considered
- try to increase level of interest - obtain feedback on alternatives
- aim to move into work together area

Methods for engagement with this group would include Intranet, Wiki, SharePoint and reports.

Work Together

- key stakeholders who the team needs to ensure they focus efforts on - co design.
- involved in governance/decision making bodies
- engage & consult regularly – keep informed.

Methods for engagement with this group would include personal communication, email, Workshops, forums, Intranet, Wiki, SharePoint and reports.

Show Consideration

- make use of interest through involvement in low risk areas
- keep informed & consult on areas of interest – provide information
- potential supporter/ goodwill ambassador

Methods for engagement with this group would include forums, Intranet, Wiki, SharePoint and reports.

Monitor

- minimal effort
- inform via general communications

Methods for engagement with this group would include Intranet, Wiki, SharePoint and newsletters.

5.8.2 Stakeholder Matrix for BPM CoE Team

The following table provides an analysis of the engagement of the stakeholder group. It is described in broad terms and as stated previously looks beyond specific activities.

5.8.3 Scope of Engagement

Stakeholder group	Impact on						
	General Information on BPMN, ARIS and Team	Modelling and Project support	Training and Aris Support	Updates to Standards and Conventions	EA/ARIS and/or RMF Consultation	Information and Consultation	Governance and Team Information and Accountability
National Manager Transformation Projects Division (BPM Sponsor)	✓						✓
Workload Management Branch	✓	✓				✓	✓
Workload Management Branch PMO							✓
SAP Application Lifecycle Mgmt. Team/Enterprise Testing Branch	✓				✓		
Portfolio Analysis Support and Services Team (PASS) /ICT Portfolio Mgmt.					✓		
Enterprise Architecture/ICT Infrastructure					✓		
Business Process Improvement Team/Operations Projects	✓	✓	✓	✓		✓	
Business Process Design Team/Families Division	✓	✓		✓	✓	✓	
Service Delivery Business Model Project Taskforce	✓					✓	
Inflight Project Managers		✓					
Other DHS Departmental Divisions	✓	✓	✓	✓			
DHS Employees	✓		✓				

5.8.4 Influencers

An influencer is an individual or organisation who has above-average impact on the BPM Discipline. Influencers are not part of the Department, but are connected to key roles within other government departments, private organisations and educational or training organisations.

Our influencers are leaders in BPM with whom we interact to exchange knowledge and experience - as well as networking. The influencers we are looking to engage with and the nature of engagement are detailed below.

Influencers in BPM	Nature of Engagement
Queensland University of Technology	BPMN and ARIS Training Student Project work Possible ARC Linkage project
BPM Roundtable	Brisbane Based forum for BPM Practitioners who meet quarterly.
